

Dental Urgent Care

ABOUT I-CAT IMAGING

Computer assisted radiological imaging offers a 3-dimensional representation of jaw and face structures with comparable radiation exposure to that of dental panoramic imaging. The data gathered exceeds the dental structures and there may be added medical value in the data (some facial sinuses, jaw joint & skull structures). This scan is not completely applicable for orthodontic purposes. This clinic provides non-contrast images; contrast images provide more diagnosable data to evaluate soft tissue.

Dr. Heinze is not qualified to read the images for purposes other than those related to dental structures. The image may be useful for evaluation of fluid in the sinuses.

The scan may be read by physician radiologists for medical purposes.
